

## FEDERATED EA CERTIFICATION FEA/COMMERCIAL PROGRAM PROJECTS IN THE FALL 2011 CLASS

### The Class Practicum Projects Demonstrate Relevancy of EA

At recalibration in first day of the Second week of FEAC's Federated EA Certification Program each of the student teams presents the draft models and plans for completing their practicums, a requirement that must be successfully completed, to pass the program. This is the fall semester 2011 and the projects are in sync with the current topics raging in blogs and IT news periodicals. They include:

- Architecting Data Center Consolidation across a large business function for a part of the government with an international mission. (***Data Center Consolidation***)
- An architecture, using an existing government contract, to prototype a means for aligning the technology services vendor's IT to its customers IT and documenting such efficiently and effectively. (***Matching IT Capabilities – Services Provisioning***)
- An Architecture for a Mail Order Proscription Drug Service for a large government health program. (***Healthcare Provisioning***)
- An Architecture to help architect Customer Solutions for a fast-growing Internet Service Provider Company (***Ist Responder Communications***)
- An Architecture to deliver analysis and information to City law enforcement Personnel in the field. (***Data and Applications Consolidation***)
- A Segment Architecture for business area around government-wide geospatial services provisioning for a part of a cabinet agency (***Geospatial Data Management***)
- A High-school Technology Infrastructure Architecture (***IT Architecture***)

The relevancy and currency of these projects just hits you smack in the think tank. The FEAC Institute didn't plan these topics. The students enrolled in this certification class brought these projects with them from their work site. They are learning the direct value of EA and the modeling approaches taught to solving and adding value to achieving these tasks and solving problems and complex issues.

If you just scan the current topics of the day or open most any CIO or IT magazine and there are these and/or very related topics that are receiving direct attention everyday. EA methods and capabilities are critical to support these initiatives and others like them, the relevant topics of now.
